Abstract

The present invention is the method to trap reliably the reaction intermediates of an oxidoreductase, such as cytochrome-c oxidase.

- The present invention is a method for trapping reaction intermediates of an oxidoreductase comprising the steps of:
 - (the first step) dissolving an oxidoreductase, a photoinduced reducing agent that releases electrons by light-irradiation, amine-type electron donor and a substrate for said oxidoreductase in water and mixing these;
- 10 (the second step) cooling the mixture prepared in the first step to 70~270K to be frozen;
 - (the third step) irradiating the frozen mixture prepared in the second step at 70~270K with a light in a wavelength region including the absorbing wavelength of said photoinduced reducing agent; and
- 15 (the fourth step) raising the temperature of the frozen mixture prepared in the third step to the temperature of 80~270K that is higher than the temperature of the third step.
